Section 1

Exercise 1.1.i

(i) Let $f: x \to y$ be a morphism and $g, g': y \to x$ be inverses. Then $fg = \mathrm{id}_y$ and $gf = \mathrm{id}_x$ (resp g'). Hence gf = g'f so

$$gfg = g'fg$$
$$g = g'$$

Therefore any morphism has at most one inverse. ///

(ii) Suppose there are morphisms $g, h: y \Rightarrow x$ such that $fg = \mathrm{id}_y$ and $hf = \mathrm{id}_x$. Then

$$hfg = h$$
$$q = h$$

Hence $fg = id_y$ and $gf = id_x$ so f is an isomorphism. ///

Exercise 1.1.ii Consider a category C and the subset of isomorphisms it contains. The subset contains the identity morphisms for each object because the identity is an isomorphism. The subset inherits associativity from C. Now pick two isomorphisms $f: x \to y$ and $g: y \to z$ and consider gf. We have $(f^{-1}g^{-1})gf = f^{-1}g^{-1}gf = f^{-1}f = \mathrm{id}_x$ and $gf(f^{-1}g^{-1}) = \mathrm{id}_y$ so gf is also an isomorphism. Hence C contains a maximal groupoid. ///

Exercise 1.1.iii

(i) Observe that for any object $f: c \to x$ in c/C, the morphism $\mathrm{id}_x: x \to x$ is the identity morphism for f. Now pick two morphisms in c/C, $h: x \to y$ and $k: y \to z$ and consider kh.

Because hf = g and kg = b we have khf = b so kh is a morphism in c/C which is enough to show it is a category. ///

(ii) A similar argument as above shows that C/c is a category. ///

Section 2

Exercise 1.2.iii Let $f: x \hookrightarrow y$ and $g: y \hookrightarrow z$ be monomorphisms and $h, k: w \to x$ be morphisms such that gfh = gfk. Because g is monic, it follows that fh = fk. Similarly, because f is monic we have h = k. Hence gf is monic.

Now suppose f and g are simply morphisms and that gf is monic. BWOC suppose that f is not monic. Then there exist morphisms h, k such that fh = fk but $h \neq k$. Hence

Isaac Van Doren Chapter 1 January 24, 2023

we have gfh = gfk this is a contradiction because gf being monic implies that h = k. Hence f is monic.

Now observe that the monomorphisms in a category form a subcategory. Every object has an identity morphism because the identity is monic. Associativity is inherited from the larger category and composition is preserved because the composition of two monomorphisms is also a monomorphisms as shown above.

By duality the epimorphisms also form a subcategory. ///

Exercise 1.2.iv Q: What are the monomorphisms in Field. Haven't been able to crack this one yet.

Exercise 1.2.v In Ring, consider the inclusion map $i: \mathbb{Z} \hookrightarrow \mathbb{Q}$. Now pick two morphisms, $f, g: R \rightrightarrows \mathbb{Z}$ such that if = ig where R is some ring. Now BWOC suppose that $f \neq g$. Then there exists an $r \in R$ such that $f(r) \neq g(r)$. Hence $i(f(r)) \neq i(g(r))$ so $if \neq ig$ which is a contradiction. Hence the above implies that f = g so i is monic.

Now pick morphisms $h, k : \mathbb{Q} \rightrightarrows R$ such that hi = ki. This means that for all integers z, h(z) = k(z). Each rational q may be written canonically as nd^{-1} for $n, d \in \mathbb{Z}$. Hence $h(q) = h(nd^{-1}) = h(n)h(d^{-1})$. Further, because every element in \mathbb{Q} is a unit, $h(n)h(d^{-1}) = h(n)h(d)^{-1}$. Because h and k agree on the integers, we have $h(n)h(d)^{-1} = k(n)k(d)^{-1}$. Hence h = k and i is an epimorphism.

 $\mathbb Q$ and $\mathbb Z$ are not isomorphic in Ring because $\mathbb Q$ is a field while $\mathbb Z$ is not. Hence in Ring, monic and epic does not imply isomorphism. ///

Exercise 1.2.vii For a given subset of objects $A \subseteq P$, consider $M_A = \{x \in \text{obj}P | \forall a \in A, \exists f \in P(a,x)\}$, i.e. the set of all elements in P targeted by a morphism from every element in A. If it exists (when could it not exist?), the supremum of A is the least element in M_A w.r.t. \leq .

By duality...

Section 3

Exercise 1.3.i Given two groups G and H, a functor $BG \to BH$ is a group homomorphism. Given such a functor F, and elements $x, y \in G$, that is morphisms in BG, we have F(x)F(y) = F(xy) which is exactly a group homomorphism. ///

Exercise 1.3.iv First observe that C(c, -) and C(-, c) both preserve identities. Consider the action of C(c, -) on $\mathrm{id}_x : x \to x$. id_x maps to post composition by the identity on C(c, x) which is the identity morphism for C(c, x). Similar reason applies for C(-, c).

Now pick two morphisms $f: x \to y$ and $g: y \to z$ in C. Then $C(c, -)g \cdot C(c, -)f = g_*f_* = (gf)_* = C(c, -)(gf)$. Hence C(c, -) is in fact a functor. A similar argument shows the same holds for C(-, c).

Is this by duality? ///

Exercise 1.3.viii Consider the trivial Functor $\mathbf{0}: \operatorname{Set} \to \operatorname{Set}$ that maps every set to \emptyset and every morphism to $\operatorname{id}_{\emptyset}$. Observe that this is indeed a functor because $\mathbf{0}(\operatorname{id}_x) = \operatorname{id}_{\mathbf{0}x} = \operatorname{id}_{\emptyset}$ and $\mathbf{0}(gf) = \mathbf{0}(g)\mathbf{0}(f) = \operatorname{id}_{\emptyset}$. Now pick any morphism in Set that is not an isomorphism. It is mapped to $\operatorname{id}_{\emptyset}$ which is an isomorphism. Hence functors do not reflect isomorphisms. ///

Exercise 1.3.vi Consider the map dom : $F \downarrow G \to D$ that takes an object $(d, e, f) \mapsto d$ and a morphism $(h, k) \mapsto h$. Now pick an identity morphism $(\mathrm{id}_d, \mathrm{id}_e)$; clearly this functor preserves identity. Now pick a composable pair of morphisms (h, k) and (h', k'). We have $\mathrm{dom}((h', k')(h, k)) = \mathrm{dom}(h'h, k'k) = h'h = \mathrm{dom}(h', k')\mathrm{dom}(h, k)$. Hence dom is a functor. Define cod analogously. /// (Is this right?)

Exercise 1.3.x Consider the mapping Conj : Group \rightarrow Set that takes a group to the set of its conjugacy classes and a homomorphism to mapping between the

$$\begin{aligned} \operatorname{Conj}: \operatorname{Group} &\longrightarrow \operatorname{Set} \\ G &\longmapsto \operatorname{Conj}(G) \\ (f:G \to H) &\longmapsto (f':\operatorname{Conj}(G) \to \operatorname{Conj}(H)) \end{aligned}$$

Where f' maps a conjugacy class containing an element x to the class in H containing f(x) (need to show this is well defined)
